**SUBJECT: New Finishing Tool for 10 Series and
100 Series EarthMasters**

Date: 23 January 2013

Gentlemen:

We are excited to announce the introduction of a new 4-Bar Spike Harrow Finishing Attachment for the 10 Series EarthMaster. This tool, shown in the photo below, provides a smoother surface finish behind the EarthMaster, helping break up clods and level off the ridges that are left by our EarthMaster's ripper shanks. It works well in both heavy and lighter soils, making it a great tool for a wide range of conditions.

In addition to being available for new 10 Series EarthMasters, the new harrow attachments can be retrofitted onto existing 100 Series machines, the 1700, 2200 and 2200F, and the 2500. This ability to retrofit may enhance the value of your dealer's used machines since it allows him to match his used machines to his customers' field surface finish requirements.

These attachments are available for 24" and 30" shank spacing. The attachments for the 22' and 25' machines include folding mechanisms to stay within the same transport width constraints as the base machine. Pricing is shown in the new price books that have just gone out.

If you have any other questions, please call.

Thank you and keep up the good selling.
